Blended Fertiliser

Custom Fertilisers

J&H Bunn Ltd, one of the largest fertiliser blenders in the U.K., has developed an in-depth understanding of technical factors for nearly 200 years and used that expertise to create performance-driven solutions for the precise demands of your crops. Since introducing blended fertilisers in the 1960s, Bunn has continued to provide innovative solutions through quality raw materials that are sourced to be both size and density matched. All of these nutrients are screened during formulation to ensure that each fertiliser is blended for optimum performance.

Soil Testing

Every agricultural environment is unique. Bunn offers the professional ability to examine your soil and prescribe the ideal blend of nutrients based on cropping and environmental needs. Through an efficient global network, a diverse selection of straight, blended and value-added fertilisers are available in 600kg and 1,000kg bags.

Wax Coating

Logistics, weather and seasonal demands should not prevent you from obtaining the right nutrients at the right time. All blended fertilisers from Bunn are wax-coated to prevent dust and/or compaction during storage, thus ensuring optimum spreading and performance. Price advantages are usually available for ordering pre-season delivery. Finished products from Bunn are stored under cover to further enhance quality.

Spreading Convenience

Bunn is a complete solutions provider. Ask a representative about the hauling and spreading services that are available for applying fertiliser to your fields.
